General Trauma
This protocol should be followed for severely injured patients meeting trauma triage
guidelines and methodology; including chest injuries, and patients with symptoms of spinal
cord injury, along with extremity weakness, numbness or sensory loss. It consists of
assessment, stabilization, extrication, initiation of resuscitation, and rapid transportation to
the closest appropriate facility.

Aliases: Trauma, injury, injuries

GENERAL TRAUMA MANAGEMENT
1. Follow General Pre-hospital Care Protocol.
2. Stabilize spinal column while opening the airway, determine level of consciousness. Refer to
Spinal Injury Assessment Protocol.
3. Manage airway and ventilation per Emergency Airway Procedure. Avoid
Hyperventilation/Hyperoxgenation.
5. If shock present, refer to Shock Protocol.
6. Refer to Mass Casualty Incidents Protocol if appropriate.

7. Initiate transport according to the Trauma Triage Protocol or refer to applicable MCA
Protocol.
8. Alert receiving hospital as soon as appropriate. Include pertinent trauma triage criteria.

9. Obtain vascular access (in a manner that will not delay transport).

CHEST INJURY
2. Assess, monitor, and treat life threatening respiratory problems.
   A. Administer oxygen to maintain a pulse oximetry (if available) of 94% to 99%. Avoid
      positive pressure ventilation if possible.
   B. All open and/or sucking chest wounds should be covered with an FDA and MCA
      approved occlusive seal device, or improvised occlusive dressing.
      1. Release dressing if worsened shortness of breath, or signs of tension
         pneumothorax.

3. If tension pneumothorax suspected, perform needle decompression per Pleural
   Decompression Procedure.

ABDOMINAL INJURY
1. Cover intestinal eviscerations with a sterile dressing moistened with sterile saline or water;
   cover the area with an occlusive material (aluminum foil or plastic wrap). Cover the area with
   a towel or blanket to keep it warm. Transport with knees slightly bent, if possible. DO NOT
   PUSH VISCERA BACK INTO ABDOMEN.
Follow General Pre-hospital Care Protocol.

- Stabilize spinal column while opening airway, determine level of consciousness. Refer to Spinal Injury Assessment Protocol.
- Manage airway ventilation per Emergency Airway Procedure. Avoid Hyperventilation/Hyperoxygenation.
- Control major external bleeding. Refer to Soft Tissue and Orthopedic Injuries Protocol.
- If shock present, refer to Shock Protocol.

Initiate transport according to Trauma Triage and Destination Protocol or refer to applicable MCA Protocol.

- Obtain vascular access (in a manner that will not delay transport).

Refer to Pain Management Procedure as needed

If hypotensive, refer to Shock Protocol

Chest Injury

Control hemorrhage per Soft Tissue and Orthopedic Injuries Protocol.

Assess, monitor, and treat life threatening respiratory problems.
- Administer oxygen to maintain a pulse oximetry (if available) of 94% to 99%. Avoid positive pressure ventilation if possible.
- All open and/or sucking chest wounds should be covered with an FDA and MCA approved occlusive seal, or improvised occlusive dressing.
  - Release dressing if worsened shortness of breath, or signs of tension pneumothorax.

Abdominal Injury

- Cover intestinal eviscerations with a sterile dressing moistened with sterile saline or water; cover the area with an occlusive material (aluminum foil or plastic wrap).
- Cover the area with a towel or blanket to keep it warm. Transport with knees slightly bent, if possible.
- DO NOT PUSH VISCERA BACK INTO ABDOMEN.
