

CERNER FLASH

Ambulatory: CommonWell & Outside Records Package

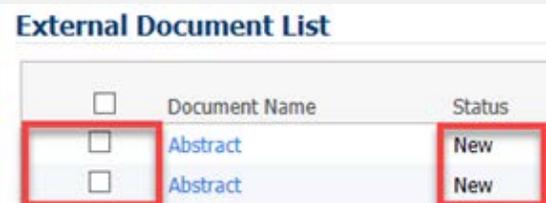

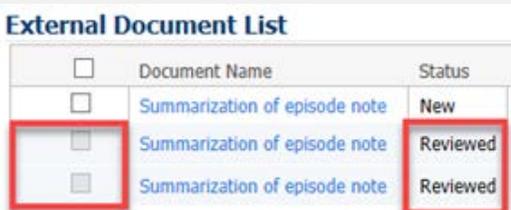

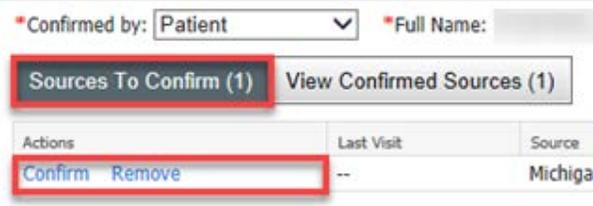

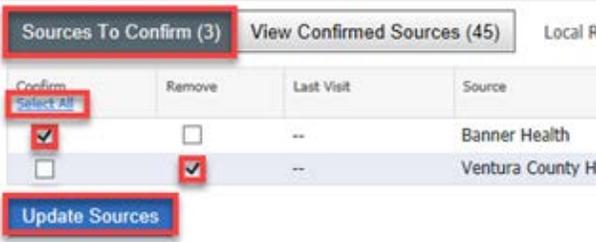

Friday, June 26, 2020

Overview of Update

Update: A new package for the Outside Records component has been installed. The package is intended to correct error messages and time out issues. Users will also notice a few minor changes when using the Outside Records/CommonWell functionality as described below.

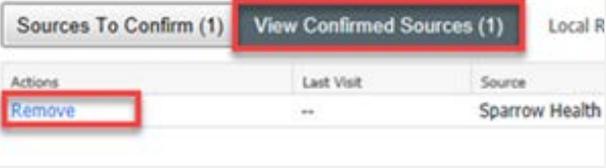

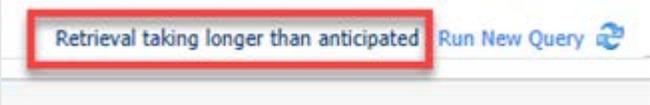

Positions Impacted: All positions using the Outside Records component.

Overview of Changes

Before	Now
<p>External Documents List: After saving a document to the chart, the checkbox next to the document could be reselected and the status would still display as New.</p> 	<p>Once saved, the checkbox next to the document will be dithered and unable to reselect. The status of the document will display as Reviewed. This lets the user know the document has already been saved to the chart.</p> 
<p>Sources To Confirm tab: Users would select Confirm or Remove from the Actions column next to each individual Source.</p> 	<p>Confirm & Remove are now columns with checkboxes that can be selected individually. Select All can be used to select all of the boxes in the Confirm column at once. Click Update Sources when done.</p> 

CERNER FLASH

Before	Now
<p>View Confirmed Sources tab: users would select Remove from the Actions column to remove sources.</p> 	<p>Remove is now a column with checkboxes that can be selected individually next to the items you wish to remove.</p> 
<p>Time out Issue: Users would get a “Retrieval taking longer than anticipated” time out error when running a New Query from the External Documents List.</p> 	<p>This retrieval error will no longer occur. The Run New Query process will take 30 seconds or less.</p> 
<p>Outside Records MPage: Would not load when selecting the Outside Records tab from the Menu Bar due to an incorrect script.</p>	<p>Outside Records now performs as expected and will load without issues.</p>
